Visiontron creates custom Rolling Walls for MetLife Stadium.

MetLife Stadium asked us to provide two solutions; one to replace folding partition walls in their service tunnel, and the other to provide semi-permanent walls to hide storage areas.

The stadium used partition walls to divide the service tunnel in half when the players were leaving or entering the locker room. The space is shared by their operations team and players, and is also utilized to provide guest access to certain parts of the stadium.

Our solution to replace the partition walls had to be:

- Easily deployable.
- Light-weight but sturdy.
- Tall enough so that guests could not see over them.
- The gap between the panels had to be as minimal as possible so that guests could not see players and staff through them.

Our solution was to design and manufacture a Rolling Wall made from 12' wide x 6' tall panels built on lockable wheels. Each panel could be connected to the next or used as a stand-alone section. The construction ensured it would not flex as it was moved, allowing multiple panels to be moved at the same time.

For the storage areas we utilized our 6' tall Privacy Panels, providing an elegant but sturdy solution that enabled an area to be 'cleaned up' but still be functional.

Each of these solutions can be customized depending on the size and finishes needed. For example, you may require a smaller 6' wide x 4' tall Rolling Wall and want it to have branded panel inserts. Having both our design and manufacturing teams in-house make just about any customization possible.
